Project: Simple book shop management program.

We started our project with a structure named book. There are 8 functions there,

One main function and the other are called.

*Book title: There is char book title which can store maximum 50 characters.

*Author name: Which can store maximum 30 characters.

*Book price: Float book price can store decimal numbers.

*Copies: Int copies can number of copies in the book shop.

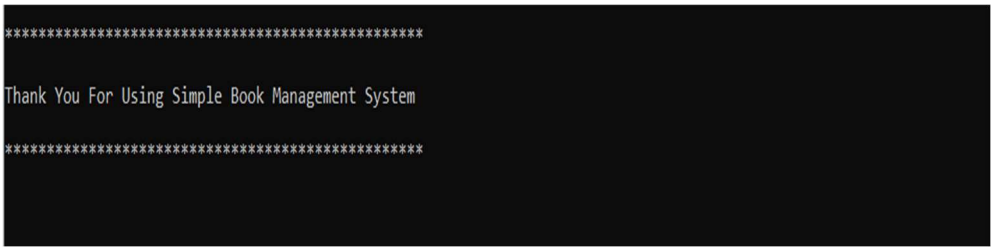

showWelcomeMessage()

When we called this function, the program will show Welcome message.

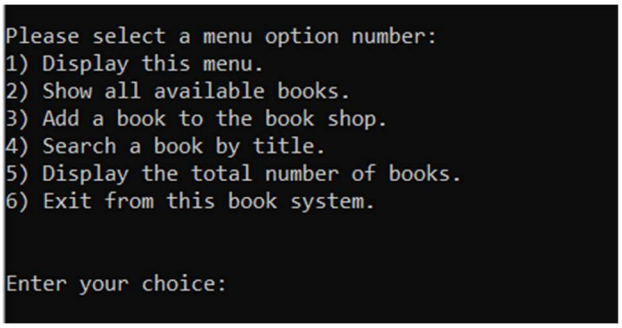

ShowGoodByeMessage()

When this function is called, the program will show Good bye message.

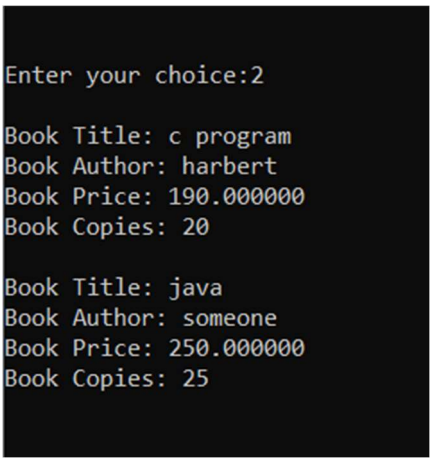

ShowMenuOptions()

When we called this function, the program will display the menu options.

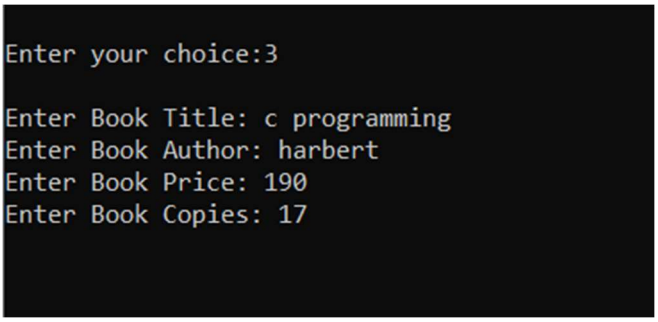

Showbooks()

When this function is called, the program will display all the books in the shop and also its details.

addbook()

This function will show the details of books we wanted to add. like:

searchbook()

When this function is called, the program will display the book we wanted to search. If it is found the program will display everything about the book. If it is not found the program will display “not found”.

```
Enter your choice:4

Enter book title to search: c programming
Book title: c programming
Book author: harbert
Book price: 190.000000
Book copies: 26
```

showNumberofBooks()

When this function is called, the program will show the total number of books.

```
Enter your choice:5

Total number of books in the shop: 45
```

main()

When we run the program the output display Welcome message and show us the menu option and wait for input.

```
****************************************

Welcome to Simple Book Management System.
